This crossmember is designed to fit rubber mount P/N 716101-2

This crossmember is designed to fit the NV4500 transmission into 1966-77 Ford Broncos. This crossmember piece bolts directly to the stock frame rails using the stock frame holes. This crossmember works in conjunction with our rubber mount P/N 716101-2. Ford frame rails are tapered from the front to the back, so our crossmember mount has this same taper. When fitting the crossmember between the frame rail, a rubber mallet may be necessary to knock it into position. One of the prototype vehicles that we installed the crossmember into had some welds on the inside frame rails that needed to be ground off before the crossmember would fit. Due to the age of these vehicles, the frame rail width may vary, which could cause some proper fit issues.

Because of tight tolerances, the crossmember holes to the frame have been oversized to allow for some adjustment. We have also slotted the holes in the crossmember tube to allow for some vehicle variances. Once the crossmember has been secured to the frame, be sure to secure the rubber mount to the tubular section of the crossmember mount. The new crossmember is also a tight fit between the transfer case and transmission. A notch has been cut in the crossmember for clearance of the Dana 20 front output retainer bolt. This notch is necessary on applications using the stock transfer case rotation.
